

Risk Management: Cyber Security Attacks

Dr Emily Barrick

Keywords: Cyber Attack,

1. Management of the Initial Phase of a Cyber Security Attack

Gone are the days of just worrying about having your common risk management plans of natural disasters and disease outbreaks. It's time to add cyber security attacks to your risk portfolio. This presentation will start by outlining what happens in the initial hours and days of an attack all the through to years after. How do you ensure compliance? What happens when the computers lock everyone out of animal hold rooms? Think the unthinkable and then learn how to put a plan together to mitigate them all.

2. Safe-guarding and Futureproofing

With hackers always one step ahead, it is important to have strategies in place to review computer management and record keeping methods within an animal facility. Having two systems available, one computerised and one manual, may be the best way forward. Insights into an actual case of a cyber attack relating to an animal facility will be shared, along with how things evolved, the management steps implemented and plans to attempt to futureproof against further attacks will be discussed.
